Warszawa - WIAD. LEK. 1957, 10/21 (987-991)

Description of a case of hepatitis due to chlorpromazine in a woman aged 28 yr.
The jaundice appeared in the 4th week of treatment with small doses (3 times
25 mg. daily).

AKTUALNA MEDICA Sec. 6 Vol. 11/10 Oct. 57
KUBICKI S.

6343. KUBICKI S. Odd. Wewn̄tr. Centr. Szpit. Klin. MSW, Warszawa. * Fizjopatologia śpiączki wątrobowej i jej leczenie. Physiopathology of hepatic coma and its treatment POL. ARCH. MED. WEWN̄T. 1957, 27/2 (185-200) Graphs 1

Recent theories are presented with especial consideration of investigations on the behaviour of ammonia in liver diseases and its connection with the symptoms of coma. It is not possible to show any specific biochemical changes in hepatic coma which would make it possible to differentiate the cases of liver failure with coma from analogous cases without coma. The principles of treatment of hepatic coma are presented, and the therapeutic value of the drugs chlortetracycline, ACTH and cortisone and glutamic acid is discussed. Treatment with glutamic acid, in 7 personal cases of hepatic coma and pre-comatose states brought about a complete recovery in one case, a lasting abolition of pre-comatose phenomena in 2 cases and a temporary alleviation of the pre-comatose state in one patient, while in 3 cases of profound coma glutamic acid had no effect at all.

"Severe Hematuria in Pregnancy. Case Report"

Warsaw, Poleki Tygodnik Lekarski, Vol XVIII, No 8, 18 Feb 1963, pp 303-305

Abstract: Author's English summary modified. Severe hematuria and hydronephrosis in a pregnant woman are reported. Attention is drawn to this complication and to the treatment of secondary anemia. Hematuria is the only sign characteristic of this disease. The disease occurs seldom, in the case reported hematuria was severe, lasted for a long period and disappeared spontaneously after delivery. 2 illustrations; 5 references, 2 Polish, 3 Western.

"Clinical Evaluation of 30 Cases of Gall Bladder Cancer."

Warsaw, Polski Tygodnik Lekarski, Vol 18, No 13, 25 Mar 63,
pp 470-474.

Abstract: [Authors' English summary modified] An analysis of 30 cases of gall bladder cancer brought authors to the conclusion that "Early cholecystectomy" should be performed in patients suffering from cholelithiasis because of the frequently coexisting cancer and the fact that at present it is the only way to bring about improvement in these tumors, which have heretofore eluded treatment. There are ten (10) references, of which one (1) is Polish, and the other Western.

TITLE: The Measurement of Neutron Flux with Nuclear Emulsions
Filled with Lithium (Měření neutronového toku nukleárními
emulzemi plněnými lithiem)

PERIODICAL: Československý Časopis Pro Fysiku, 1958, Nr 6,
pp 706 - 711 + 1 plate (Czech)

ABSTRACT: In 1935 Taylor and Goldhaber (Ref 1) suggested the use
of photographic emulsions for detection of neutrons. A
year later Taylor and Dabholkar (Ref 2) filled a photo-
graphic emulsion with a salt of lithium and observed the
tracks due to the disintegration of Li by neutrons. The
possibility of measuring neutron fluxes by nuclear
emulsions has been discussed by Titterton and Hall (Ref 7).
Further work in this field was reported in 1952 and 1954,
(Refs 8, 9). The purpose of the present work was to check
the method of measuring the neutron flux by means of a
nuclear emulsion (prepared by Dr. Kubal of the Institute
of Nuclear Physics of the Czechoslovak Ac.Sc.) filled with
 Li_2SO_4 .

Eqs (1) to (4) show the types of nuclear reactions which
can occur in an emulsion filled with Li or B when

Card1/4

CZECH/37-58-6-13/30

The Measurement of neutron Flux with Nuclear Emulsions Filled with
Lithium

neutrons pass through it. The reaction $^6\text{Li}(\text{n},\alpha)^3\text{H}$ is the most useful one because of the long tracks of the particles. The tracks of the α -particle ($6,7 \mu$) and of the tritium (36.3μ) lie in a straight line but in opposite directions. This reaction was used for all the experiments described below.

The theoretical efficiency of the measurement R is the ratio of the number of the observed reactions per cm^2 of the emulsion to the number of neutrons which passed through this area. The effective cross-section of ^{18}Li

of natural lithium is 6.3 cm^2 . To evaluate R_{12} , one therefore needs to know the amount of Li per cm^2 .

The source of neutrons was a mixture of radium with beryllium. The emulsions were all experimental emulsions and the Li_2SO_4 was added to them before casting them on

glass plates. The main source of errors was the indeterminacy in the actual amount of Li per cm^2 .

The photographic plates were exposed to the neutrons and processed in the normal way. Only those tracks were counted
Card2/4

CZECH/37-58-6-13/30

The Measurement of Neutron Flux with Nuclear Emulsions Filled with
Lithium

which were fully contained in each field of $3.8 \times 10^{-4} \text{ cm}^2$, which necessitated the multiplication of the observed number by a correction factor 1.17 (Ref 10). The average number of tracks per field was calculated from observations on 45 fields lying in one band and then averaged for 4 such bands. The distribution of the total lengths of tracks ($\alpha + t$) had a maximum at 43μ (Fig 3). This is in agreement with Gimenez (Ref 9), while Titterton (Ref 7) has found 42μ .

Table 2 gives the amount of lithium in each of the five emulsions used and also the number of tracks that the emulsion should theoretically contain for every 1 000 neutrons hitting it per cm^2 . The neutron fluxes thus computed are tabulated in Table 3, together with the deviations of these figures from those measured by a control method. This consisted of the activation of

^{197}Au by the neutrons and the measurement of the β -activity. The neutron flux measured by the absolute method was $1.070 \times 10^3 \text{ neutrons cm}^{-2} \cdot \text{sec}^{-1}$. The errors

Card 3/4

The Measurement of Neutron Flux with Nuclear Emulsions Filled with
Lithium

CZECH/37-58-6-13/30

of measurement with the emulsions were between 16.8 and 52.3% (Table 3). The recorded errors may be taken into consideration and then the emulsions may be successfully used for the determination of whether or not a worker has been exposed to more than the permissible flux of neutrons. There are 3 figures, 5 tables and 21 references, 18 of which are English, 2 French and 1 Czech.
